

Chomsky – Integrated Method on the Bias of Science

Introduction
By Noam Chomsky

Now if one has basic
disciplines with thesis-
anti-thesis and synthesis
then one cover marginal
utility, consumer index,
and even capitals,
factors of production,
scale economies and
even demand and

supply curves and this then becomes a basic study – advanced further by an anti-thesis Keynes and becomes Stieglitz and even in fact mixed economics and Annales.

Now the perception of this as an anti-thesis called monadology studies – a set of monads in pure graphs like a Harvard-Princeton argument

with the exception it is pure.

1.1 -2,...4 - Advanced -
When perception is privileged and science is followed in perception - it becomes like monadology - it is more perceptive though than normal accounts of integrated method which simply refines

the argument – like
a Spinozan orrey.

2. How to cover
Spinozanism – an Orrey
of integration –

1. A Shop and its
Proven Science –
perhaps a pharmacy
being covered.

2. Now integrate this
shop with other
shops, and now
integrate this with
labour and unions,

and then integrate this with agrarian peasants and its final accrument of profits for companies which then is accounts as a major legal invention.

2-3,4,5-6—1---Advanced and Basic Studies combined

All this means is basic studies actually in a certain formalism –

Basic Economics, Basic
Historical Materialism,
Basic Theology and
even Basic Physics and
Inventions, to go with
Basic Philosophy.

Now this means how a
shop, integration to
shop, and agriculture,
manufacturing and even
financialization – is
finally a syntax Marx
discovers in his labour
theory of value.

Just now that as
scientific – and science
like in monadology and
graph theory – it is the
perception which guides
the monadology.
